This question is about water.

River water needs to be treated before it is safe to drink.

(a) The diagram shows two stages of the treatment of river water.

(i) What is the name of the process used to remove solid particles in **Stage 1**?

Tick (✓) **one** box.

Crystallisation

Fermentation

Filtration

(1)

(ii) What is added in **Stage 2** to sterilise the water?

Tick (✓) **one** box.

Chlorine

Fluoride

Potassium

(1)

(b) Toxic substances in river water are removed by adding very small amounts of iron oxide nanoparticles.

(i) How is the size of nanoparticles different from normal-sized particles?

.....  
.....

(1)

(ii) Nanoparticles are needed in only very small amounts.

Suggest why.

.....  
.....

(1)

(c) In certain areas of the UK, tap water contains aluminium ions.

What would you **see** when sodium hydroxide solution is added drop by drop to tap water containing aluminium ions?

.....  
.....

This question is about diamonds.

Draw a ring around the correct answer to complete each sentence.

(a) Diamonds are found in meteorites.

(i) Meteorites get very hot when they pass through the Earth's atmosphere, but the diamonds do not melt.

Diamond has a 

high
low
very low

 melting point.

(1)

(ii) Most diamonds found in meteorites are nanodiamonds.

A nanodiamond contains a few 

hundred
thousand
million.

 atoms

(1)

(b) Diamonds are used for the cutting end of drill bits.

Diamonds can be used for drill bits because they are

hard.
shiny.
soft.

(1)

(c) The figure below shows the arrangement of atoms in diamond.

(i) Diamond is made from

carbon
nitrogen
oxygen

atoms.

(1)

(ii) Each atom in diamond is bonded to

three
four
five

other atoms.

(1)

(iii) Diamond has a giant

covalent
ionic
metallic

structure.

(1)

(iv) In diamond

all
none
some

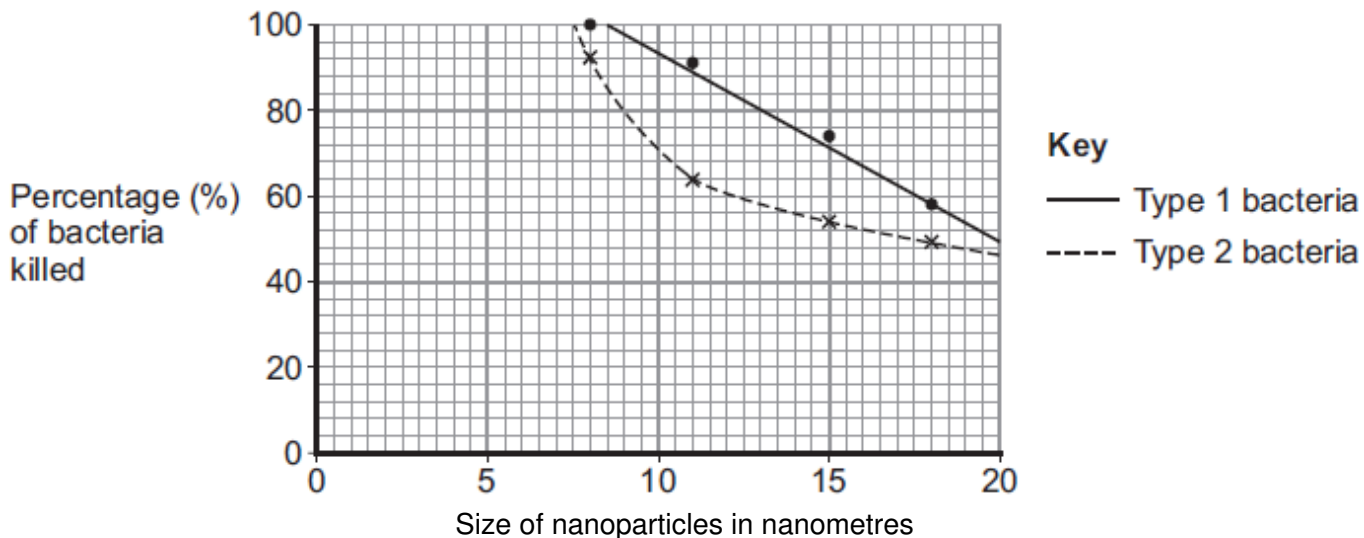

of the atoms are bonded together.

## Nanotennis!

Tennis balls contain air under pressure, which gives them their bounce. Normal tennis balls are changed at regular intervals during tennis matches because they slowly lose some of the air. This means that a large number of balls are needed for a tennis tournament.

© Feng Yu/iStock

'Nanocoated' tennis balls have a 'nanosize' layer of butyl rubber. This layer slows down the escape of air so that the ball does not lose its pressure as quickly. The 'nanocoated' tennis balls last much longer and do not need to be replaced as often.

(a) Tick (✓) the best description of a 'nanosize' layer.

Description	Tick (✓)
A layer one atom thick.	
A layer a few hundred atoms thick.	
A layer millions of atoms thick.	

(1)

- (b) Suggest **two** ways in which using 'nanocoated' tennis balls would be good for the environment.

.....

.....

.....

.....

.....

(2)

The diagram shows how a heat sink is placed on top of a processor in a computer. The heat sink is a large piece of metal which conducts heat away from the processor. If the processor gets too hot it may be damaged.

(a) (i) Describe the structure of a metal.

.....

.....

.....

.....

.....

.....

.....

.....

.....

(3)

(ii) Why are metals very good conductors of heat?

.....

.....

(1)

- (b) When viewed under a microscope, it can be seen that the surfaces of the processor and the heat sink that are in contact are not flat.  
There are lots of tiny gaps between the two surfaces.  
The gaps contain air, which does not conduct heat very well.  
Thermal grease is used to fill the gaps between the processor and the heat sink to improve the transfer of heat from the processor to the heat sink.

One type of thermal grease contains nanosized particles of silver.  
The manufacturer claims that the nanosized particles help to transfer heat better than normal sized particles.

- (i) How are nanosized particles different from normal sized particles?

.....  
.....

(1)

- (ii) Suggest **one** reason why nanosized particles of silver might help to transfer heat better than normal sized particles.

Gold and gold ions are used as catalysts.

- (a) An atom of gold is represented as:

Complete the sentences.

The atomic number of gold is .....

The number of electrons in an atom of gold is .....

(2)

- (b) Scientists have found that gold nanoparticles are very good catalysts.

Draw a ring around the correct answer to complete the sentence.

A gold nanoparticle contains a few 

hundred
thousand
million

 atoms.

(1)

- (c) The formation of a gold ion ( $\text{Au}^{3+}$ ) from a gold atom ( $\text{Au}$ ) is shown in the symbol equation.

- (i) Complete the sentence.

The particles lost when a gold atom becomes a gold ion  
are called .....

(1)

- (ii) Draw a ring around the correct answer to complete the sentence.

The number of these particles lost when a gold atom becomes a gold ion is

one.
two.
three.

(1)

- (d) Gold ions are used as a catalyst in the reaction to make chloroethene.

How does a catalyst help a reaction?

.....

(1)

- (e) Chloroethene can react to make a thermosoftening polymer.

- (i) Draw a ring around the correct answer to complete the sentence.

When heated, a thermosoftening polymer  
will

dissolve.
melt.
solidify.

(1)

(ii) Polymer **B** is a different type of polymer.

The diagram shows the structure of polymer **B**.

**Polymer B**

How can you tell from the diagram that polymer **B** is **not** thermosoftening?

Read the information about car engines.

Burning petrol in air is an exothermic reaction. This reaction is used in car engines.

When petrol burns it produces harmful substances such as nitrogen oxides and carbon monoxide.

A catalytic converter stops these harmful substances being released into the air.

(a) Draw a ring around the correct answer to complete each sentence.

(i) The exothermic reaction makes the temperature of the engine

decrease.

increase.

stay the same.

(1)

(ii) This is because during exothermic reactions

energy is taken in from the surroundings.

energy is given out to the surroundings.

there is no energy change.

(1)

(b) The diagram shows a catalytic converter which removes harmful substances. The catalytic converter has two parts, **A** and **B**, which contain different catalysts.

(i) The equation for the reaction that takes place in part **A** is:

Which **one** of the substances shown in the equation is a compound?

Give the formula of this compound.

.....

(1)

(ii) The equation for the reaction that takes place in part **B** is:

Why is it important to stop carbon monoxide (CO) from being released into the air?

.....

.....

(1)

- (c) The table lists some statements about catalysts. Only **two** statements are correct.

Tick (✓) the **two** correct statements.

Statement	Tick (✓)
A catalyst can speed up a chemical reaction.	
A catalyst is used up in a chemical reaction.	
Different reactions need different catalysts.	
A catalyst does <b>not</b> change the rate of a chemical reaction.	

(2)

- (d) Modern catalytic converters contain nanosized particles of catalyst. Less catalyst is needed when nanosized catalyst particles are used.

- (i) Complete the sentence.

The size of nanosized particles is ..... than normal sized particles.

(1)

- (ii) The catalysts contain platinum.

Suggest why a manufacturer of catalytic converters would want to use less catalyst.

Read the information about car engines.

Burning petrol in air is an *exothermic* reaction. This reaction is used in car engines.

When petrol burns it produces harmful substances such as nitrogen oxides and carbon monoxide.

A catalytic converter stops these harmful substances being released into the air.

- (a) The reaction is *exothermic*. What is the meaning of *exothermic*?

.....

.....

(1)

- (b) The catalytic converter has two parts shown as **A** and **B** in the diagram.

Part **A** contains a catalyst made from platinum and rhodium.

Part **B** contains a catalyst made from platinum and palladium.

- (i) Why are catalysts used in chemical reactions?

.....

.....

(1)

- (ii) One reaction in part **A** is shown by this equation.

Suggest why this reaction helps the environment.

.....  
.....

(1)

- (iii) The equation for one of the reactions in part **B** is shown below.

Balance this equation.

(1)

- (iv) The catalytic converter works for many years without replacing the catalyst.

Explain why the catalyst does not need to be replaced.

.....  
.....

(1)

- (v) Suggest why different catalysts are used in parts **A** and **B**.

.....  
.....

(1)

- (c) Modern catalytic converters contain nanosized particles of catalyst. Using nanosized particles reduces the cost of the catalytic converter.

Suggest and explain why the use of nanosized catalyst particles reduces the cost of the catalytic converter.

Your answer should include information about the size and surface area of the particles.

### TOXIC SOCKS?

Silver nanoparticles are added to the fibres used to make some socks. Silver has the special property that it can kill bacteria. As a result there are no unpleasant smells when wearing these socks.

Some scientists are concerned about the use of silver nanoparticles in socks.

The silver can be released from the socks when they are washed. This silver may end up in rivers. Silver in rivers may kill fish.

Scientists found that some makes of socks release the silver more easily than others. Socks in which the silver nanoparticles are trapped in the fibres released very little silver when washed.

By tfkrawksmysocks [CC BY-SA 2.0], via Flickr

(a) Suggest why silver stops unpleasant smells when wearing the socks.

.....  
.....

(1)

(b) How is the size of silver nanoparticles different from normal sized silver particles?

.....

(1)

- (c) The silver nanoparticles are more effective at preventing unpleasant smells than normal sized silver particles.

Suggest why.

.....  
.....

(1)

- (d) The silver nanoparticles should be trapped in the sock fibres.

Use the information in the article to explain why.

Read the article about the use of nanoparticles in sun creams.

**Sun creams**

Many sun creams use nanoparticles. These sun creams are very good at absorbing radiation, especially ultraviolet radiation. Owing to the particle size, the sun creams spread more easily, cover better and save money because you use less. The new sun creams are also transparent, unlike traditional sun creams which are white. The use of nanoparticles is so successful that they are now used in more than 300 sun cream products.

Some sun creams contain nanoparticles of titanium oxide. Normal-sized particles of titanium oxide are safe to put on the skin.

It is thought that nanoparticles can pass through the skin and travel around the body more easily than normal-sized particles. It is also thought that nanoparticles might be toxic to some types of cell, such as skin, bone, brain and liver cells.

(a) Explain why nanoparticles pass through the skin and travel around the body more easily than normal-sized particles of titanium oxide.

.....  
.....  
.....  
.....

(2)

(b) Explain why sun creams containing nanoparticles should be tested further.
