

1

Read this passage about metals.

Metals are crystalline materials. The metal crystals are normally about 20 000 nm (nanometres) in diameter. The atoms inside these crystals are arranged in layers.

A new nanoscience process produces nanocrystalline metals. Nanocrystalline metals are stronger and harder than normal metals.

It is hoped that nanocrystalline metals can be used in hip replacements.

The use of nanocrystalline metals should give people better hip replacements which last longer.

(a) State why metals can be bent and hammered into different shapes.

.....
.....

(1)

(b) How is the size of the crystals in nanocrystalline metals different from the size of the crystals in normal metals?

.....
.....

(1)

- (c) Hip joints are constantly moving when people walk.

Suggest and explain why the hip replacement made of nanocrystalline metal should last longer than one made of normal metals.

.....

.....

.....

.....

(2)

2

- (a) Write a balanced symbol equation for the reaction between magnesium (Mg) and oxygen (O₂) to form magnesium oxide (MgO).

.....

(1)

- (b) The diagram shows the electronic structure of a magnesium atom. The atomic (proton) number of magnesium is 12.

Magnesium atom

Draw a similar diagram to show the electronic structure of an oxygen atom. The atomic (proton) number of oxygen is 8.

(1)

- (c) Magnesium ions and oxide ions are formed when magnesium reacts with oxygen.

The diagram shows the electronic structure of an oxide ion.

Oxide ion

Draw a similar diagram to show the electronic structure of a magnesium ion.

(1)

- (d) Magnesium oxide is a white solid with a high melting point.

Explain how the ions are held together in solid magnesium oxide.

.....

.....

.....

.....

(2)

- (e) Indigestion tablets can be made from magnesium oxide. The magnesium oxide neutralises some of the hydrochloric acid in the stomach.

Complete the word equation for the reaction between magnesium oxide and hydrochloric acid.

(1)

(Total 6 marks)

3

Metals and their alloys have many uses.

- (a) Dentists use a smart alloy to make braces that gently push teeth into the right position.

What is meant by a *smart alloy*?

.....

.....

(1)

- (b) Pure copper is made up of layers of copper atoms. Brass is an *alloy* of copper and zinc.

Why are the physical properties of brass different from the physical properties of pure copper?

.....

.....

.....

.....

(2)

- (c) Nearly all zinc is obtained from ores that also contain lead. The metals zinc and lead can be extracted by reducing their oxides using carbon.

- (i) Choose **one** element from the box below to complete the sentence about the reduction of zinc oxide.

lead	nitrogen	oxygen
-------------	-----------------	---------------

Zinc oxide is reduced by carbon, which takes away.....
to leave zinc metal.

(1)

- (ii) The melting points and boiling points of lead and zinc are given in the table.

Metal	Lead	Zinc
Melting point in °C	328	420
Boiling point in °C	1740	907

The furnace operates at a temperature of 1200 °C.

Suggest how the lead metal and zinc metal are separated in the furnace.

.....

.....

.....

.....

(2)

(Total 6 marks)

4

Bricks made from silica (silicon dioxide) are used to line furnaces that operate at high temperatures.

Part of the structure of silica is shown in the diagram.

Use words from the box to complete the sentences.

covalent	giant	low	small
four	high	six	weak

One reason for using silica to make bricks for high-temperature furnaces is that silica has a melting point.

Silica has this property because it is a structure in which each silicon atom is joined to oxygen atoms by bonds.

(Total 4 marks)

5

Bricks made from silica (silicon dioxide) are used to line furnaces that operate at high temperatures.

Part of the structure of silica is shown in the diagram.

Suggest and explain why silica is used to make bricks for high-temperature furnaces. In your answer, you should refer to the structure of, and bonding in, silica.

6

Aluminium is a useful metal.

(a) The atomic number (proton number) of aluminium is 13.

Complete the diagram to show the electronic structure of an aluminium atom.
Use crosses (x) to represent the electrons.

(1)

(b) Aluminium is used as the electrical conductor for overhead power cables.

Explain why metals are good conductors of electricity.

.....

.....

.....

.....

(2)
(Total 3 marks)

7

Many everyday items are made from iron.

(a) Haematite is an *ore* of iron. Haematite contains iron oxide, Fe_2O_3 .

(i) What is the meaning of the term *ore*?

.....

(1)

(ii) Iron can be produced by reacting iron oxide with carbon in a blast furnace.

What type of reaction produces the iron?

.....

(1)

(iii) The word equation for this reaction is:

iron oxide + carbon \rightarrow iron + carbon dioxide

Complete and balance the symbol equation for this reaction.

..... Fe_2O_3 +C \rightarrow +

(2)

(b) Pure iron is relatively soft and not very strong.

The iron from the blast furnace is very hard and brittle. It contains about 4% carbon and is used as cast iron.

Pure iron

Cast iron

Explain the differences in the properties of pure iron and cast iron by referring to the diagrams.

.....

.....

.....

.....

.....

.....

(3)

(c) The diagram shows the way in which iron is extracted, used and recycled.

Explain why the recycling of iron is necessary for sustainable development.

.....

8

Iron ore is the main source of iron.

(a) This was the headline in a newspaper.

‘Village protests against quarry’

The dotted line (----) on the map is drawn around the area from which a company wants to quarry iron ore.

(i) Give **one** reason that the company could give for the need to quarry the iron ore.

.....
.....

(1)

- (ii) The people who live in the village do not want the quarry because it would decrease the value of their homes.

Suggest **two** other reasons why the villagers do not want the quarry.

1

.....

2

.....

(2)

- (b) Iron ore contains the compound iron oxide, Fe_2O_3 .

- (i) Iron is extracted from its oxide in the blast furnace.

Complete the word equation for the extraction of iron.

iron oxide + → iron + carbon dioxide

(1)

- (ii) This diagram represents pure iron.

Use the diagram to explain why pure iron is described as an element.

.....

.....

.....

.....

(2)

- (iii) Pure iron is relatively soft. The iron from the blast furnace is hard and brittle. The diagram below represents iron from the blast furnace.

Use the diagram to explain why iron from the blast furnace is hard and brittle.

The drawing shows a high quality wire used to make electrical connections on a hi-fi system.

Multi-strand "OFC" copper
to maintain high signal purity

(a) Copper is used because it is a very good conductor of electricity. Copper is a typical metal.

(i) Describe the structure and bonding in a metal. You may wish to draw a diagram to help you to answer this question.

To gain full marks in this question you should write your ideas in good English. Put them into a sensible order and use the correct scientific words.

.....
.....
.....
.....
.....
.....

(3)

(ii) Explain, by reference to your answer to part (a)(i), why copper conducts electricity.

.....
.....

(1)

(iii) Explain, by reference to your answer to part (a)(i), why copper can be drawn into wires.

.....
.....

(1)

- (b) The copper used to make this wire is "OFC" copper. This stands for 'oxygen free copper'.
- (i) It is thought that when molten copper is cooled and solidified it can take in some oxygen from the air. This may slightly decrease the conductivity of the copper.

Suggest why the conductivity might be decreased.

.....

.....

.....

.....

(2)

- (ii) To make it oxygen free, the copper is heated in an atmosphere of hydrogen.

Explain how this will remove the oxygen.

.....

.....

16

The extract below was taken from a leaflet on the uses of platinum. One of the uses described was in making electrodes for spark plugs in car engines. The spark plug produces the spark which ignites the fuel in the engine.

Spark Plugs

The electrodes in a spark plug have to conduct electricity very well. Since they project into the combustion chamber of the engine, they must also be able to withstand extremely high temperatures in a very corrosive atmosphere.

Nickel-based plugs have been produced for many years. They only last a fairly short time. As the electrodes wear, combustion becomes less efficient and the petrol is not burnt completely.

Platinum and other precious metals can now be used in spark plugs. These last much longer and are more efficient. This can help to reduce air pollution.

The table below gives some information about platinum and nickel.

	MELTING POINT (° C)	BOILING POINT (° C)	POSITION IN REACTIVITY SERIES	COST (£/kg)
nickel	1455	2920	Higher than gold	2.5
platinum	1769	4107	below gold	6110

- (a) Compare nickel and platinum for use in making the electrodes in spark plugs.

A good answer should give advantages and disadvantages of each metal linking these to the properties of the metals. Marks will be given for the way in which you organise your answer.

You will need a sheet of lined paper.

(8)

- (b) (i) Describe the structure and bonding in metals.

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

(3)

- (ii) Explain why metals such as nickel and platinum are good conductors of electricity.

The following passage was taken from a chemistry textbook.

Germanium is a white, shiny, brittle element. It is used in the electronics industry because it is able to conduct a small amount of electricity.

It is made from germanium oxide obtained from flue dusts of zinc and lead smelters. The impure germanium oxide from the flue dusts is changed into germanium by the process outlined below.

STEP 1 The germanium oxide is reacted with hydrochloric acid to make germanium tetrachloride. This is a volatile liquid in which the germanium and chlorine atoms are joined by covalent bonds.

STEP 2 The germanium tetrachloride is distilled off from the mixture.

STEP 3 The germanium tetrachloride is added to an excess of water to produce germanium oxide and hydrochloric acid.

STEPS 1 to 3 are repeated several times.

STEP 4 The pure germanium oxide is reduced by hydrogen to form germanium.

- (a) Balance the equation below which represents the reaction in step 1.

(1)

- (b) Write a word equation for the reaction in step 3.

.....

(1)

- (c) Suggest why steps 1 to 3 are repeated several times.

.....

.....

(1)

- (d) The equation which represents the reaction in step 4 is shown below.

- (i) Explain what is meant by the term 'reduced'.

.....

(1)

- (ii) Calculate the mass of germanium which could be made from 525 g of germanium oxide. (Relative atomic masses: Ge = 73; O = 16).

.....

Mass g

(3)

- (e) Germanium is difficult to classify as either a metal or a non-metal.

- (i) Give as much evidence as you can from the information in this question to support the view that germanium is a metal. Explain your answer as fully as you can.

.....

Atoms of calcium, phosphorus and fluorine are represented below, each with its mass number and proton number.

40	31	19	←	mass numbers
Ca	P	F		
20	15	9	←	proton numbers

(a) Use this information to complete the table.

	CALCIUM	PHOSPHOROUS	FLUORINE
Number of protons in the nucleus	20		9
Number of neutrons in the nucleus	20	16	
Number of electrons		15	9

(3)

(b) Calcium and fluorine atoms can combine to form the compound calcium fluoride, CaF_2 .

The fluoride ion is represented by F^- .

(i) Explain how the fluorine atom forms a fluoride ion.

.....

(2)

(ii) How is the calcium ion represented?

.....

(2)

(c) Phosphorus and fluorine form a covalent compound, phosphorus trifluoride.

Complete the sentences below which are about this compound.

Phosphorus trifluoride is made up of phosphorus and fluorine

These are joined together by sharing pairs of to form

phosphorus trifluoride

(3)

- (d) (i) Sodium chloride, an ionic compound, has a high melting point whereas paraffin wax, a molecular compound, melts easily.

Explain why.

.....

.....

.....

.....

(2)

- (ii) Molten ionic compounds conduct electricity but molecular compounds are non-conductors, even when liquid.

Explain why.

.....

33

Here is a symbol equation, with state symbols, for a chemical reaction between solutions of lead nitrate and potassium chloride.

The equation tells you the formulae of the two products of the reaction.

- (a) What are the names of the **two** products?

1

2

(2)

- (b) What else does the equation tell you about these products?

.....

.....

.....

(2)

(Total 4 marks)

34

The diagrams show the giant structures of sodium chloride and diamond.

sodium chloride (melting point 801°C)

diamond (melting point 4800°C)

- (a) The equation shows how sodium chloride could be formed.

Balance the equation.

(1)

- (b) By reference to the detailed structure of sodium chloride explain fully why:

- (i) sodium chloride has a quite high melting point,

.....

.....

.....

.....

(1)

- (ii) solid sodium chloride melts when it is heated strongly,

.....

.....

(2)

- (iii) molten sodium chloride will conduct electricity.

.....

.....

(1)

- (c) By reference to the detailed structure of diamond, explain why the melting point of diamond, is higher than that of sodium chloride.

.....

.....

.....

.....

.....

(2)
(Total 7 marks)

35

- (a) The diagrams represent the atomic structures of two gases, hydrogen and helium.

Hydrogen gas is made up of diatomic molecules (molecules with two atoms).
Helium gas exists as single atoms.

- (i) How is a molecule of hydrogen formed from two hydrogen atoms?
(You may use a diagram as part of your answer)

.....

.....

.....

(2)

- (ii) Why does helium exist only as single atoms?

.....

.....

.....

(2)

- (b) Hydrogen combines with carbon to form methane.
Each molecule contains four hydrogen atoms strongly bonded to a carbon atom.

Explain why methane has a low boiling point.

.....

.....

.....

.....

(2)
